Lab07	FDs and Normalization
DS604 Introduction to Data Management, Autumn'2026; pm_jat @ dau	

In this lab, you learn to apply FD and Normalization rules exercises of drawing "relational schema" from given ER Diagrams.

Here you derive the appropriate relational schema for Lab06 problems.

Do following:

1. Use mapping rules that we have discussed in lectures.

   The solution of Lab06 has already been shared on the course website. Your goal is to draw relational schema from given ER Diagrams. For consistency purposes, use my ER Diagrams rather than your solutions of Lab06.
2. Identify minimal set of function dependencies for this database.
3. Compute the projected FD set for every relation of schema.
4. For every relation, compute the key from the projected FD set on the relation, and verify that it is the same as the one specified in your solutions in Step-1
5. Determine if each relation mapped from the ER model is in BCNF. If no, can you do the needful to bring them in BCNF?
